ELWISON DENAMPO

elwisondenampo@gmail.com | +63 945 623 2885 | Cebu, Philippines | Portfolio Link | Github | LinkedIn Profile

SKILLS

- **Backend:** TypeScript, Node.js, NestJS, Express, Prisma, Python, FastAPI, SQLAlchemy, PostgreSQL, Redis, REST APIs, JWT Auth, Socket.IO
- **Frontend:** Next.js, React, Astro, Vite, Tailwind CSS, shadcn/ui, React Query, React Hook Form, Zod, Zustand, Framer Motion, Recharts
- **AWS & DevOps:** AWS CDK, Lambda, API Gateway, DynamoDB, EventBridge, SSM Parameter Store, S3, Amplify, Docker, Turborepo, pnpm, Git, CI/CD, Vercel, Render
- **Integrations:** Stripe, DocuSign, SendGrid, Supabase, Sentry, Make.com, YouTube Data API, Spotify Web API
- **AI/ML:** OpenAI API, Groq API, LLM Routing, Prompt Engineering
- **Other:** C#, ASP.NET Core, Entity Framework Core, SQL Server, Hangfire

WORK EXPERIENCE

FULL-STACK DEVELOPER — Dr. Rena Malik, MD — April 2026 – Present

Web development for the world's most-followed urologist (2.9M YouTube subscribers, 600M+ views) — a podcast site rebuild on AWS serverless, a custom Stripe checkout, and a WordPress pre-order funnel for her debut book.

Rena Malik, MD Podcast https://podcast-new.renamalikmd.com/

Astro 6, TypeScript, AWS CDK, Lambda (Node 22), DynamoDB, API Gateway, EventBridge, Amplify, SSM

- Built and shipped a 326-episode auto-updating static podcast site with CDK-managed AWS infrastructure (Lambda, DynamoDB GSI for chronological queries, API Gateway HTTP API, EventBridge cron) — the entire backend reproducible from a single cdk:deploy
- Engineered an auto-rebuild pipeline — a daily cron Lambda upserts the Megaphone RSS feed into DynamoDB and POSTs to an Amplify build hook via an SSM-stored secret — taking new episodes from publish-to-live in under 24 hours with 0 manual deploys
- Designed a 5-tier thumbnail resolution chain across the YouTube Data API v3, Spotify Web API, and RSS sources with bounded-concurrency parallel fetches, raising unique-artwork coverage from 86% to ~92% while staying inside API rate limits

The Hard Truth — Pre-Order Funnel https://renamalikmd.com/hardtruth/

WordPress, vanilla JS, Stripe.js, Stripe Payment Element + Payment Intents, Make.com

- Built a custom Stripe Payment Element checkout (Apple Pay / Google Pay) replacing Stripe-hosted Payment Links — a 4-tier bulk pre-order flow ($397–$9,947) with a payment_intent.succeeded webhook contract to Make.com
- Engineered a hybrid metadata-storage strategy for multi-address bulk orders (up to 300 ship-to addresses), working around Stripe's 500-char metadata limit via base64-CSV metadata for small orders and a Make.com Data Store keyed by Payment Intent ID for large ones

SOFTWARE DEVELOPER — Flatrate Bookkeeping LLC — June 2026 – August 2026

TypeScript, TanStack Start, TanStack Router, PostgreSQL, Supabase, Row-Level Security, Postgres Triggers, Plaid

Development, bug-fixing and maintenance on a live Supabase/Postgres + TanStack Start accounting SaaS, working an internal bug-bounty queue of client-reported issues end to end after the founder declared the feature set complete.

- Root-caused two compounding Postgres performance bugs (a self-referencing CTE re-inlined per outer row, plus a non-sargable `UUID::text` join) in a trigger firing on every bank/credit-card account mapping — diagnosed live against production with `pg_stat_activity` and `EXPLAIN ANALYZE`, cutting a reproducible 8–9s timeout to ~1s
- Designed and shipped **Group Chat**, a limited-access contact tier letting third parties (e.g. a client's business partner) join in-app message threads while staying fail-closed from SMS/email/call history — threaded the new access level through all 3 invite-creation code paths, gated ~4 messaging endpoints behind a dedicated auth-middleware variant, and built the matching client-portal and staff-side invite UI
- Wrote and shipped 18 Postgres row-level-security policies closing an access-control gap in a **7-role RBAC system** (staff/client/admin/auditor/payroll/tax-contractor/customer-success)
- Established migration hygiene for the codebase — every schema/RPC change shipped with a hand-written revert script, gated by custom verification scripts (`tsc`, server-fn auth-middleware coverage, destructive-migration scanner) run before every production push

SOFTWARE ENGINEER — FutureThink Hub & La Chow — July 2025 - May 2026

Shipped three production platforms — an AI-powered adaptive learning platform (FutureThink Edge), a unified property management SaaS (LaChowOS), and La Chow's public marketing site with a custom admin CMS — across full-stack development, database design, third-party integrations, and DevOps.

FutureThink Edge https://www.futurethinkedge.org

Next.js, TypeScript, FastAPI, PostgreSQL, Redis, OpenAI API

- Engineered a full-stack adaptive learning platform serving 6 user roles with 86 REST API endpoints achieving P95 latency of 29ms under load — 85% below the 200ms SLA target
- Architected a config-driven multi-LLM routing layer across 4 AI providers (Gemini, DeepSeek, Grok, Claude), reducing per-query cost ~60% via subject-specific model selection and a <5ms pre-LLM curriculum enforcement classifier
- Scaled the backend to sustain 492 req/s under 500 concurrent users (k6, 590K+ iterations) and built 1,870+ automated tests (pytest, Vitest, Playwright E2E) eliminating 100% of type errors to reach Six Sigma 5.9 quality

LaChowOS https://portal.thelachow.com/

Next.js 16, NestJS 11, Prisma, PostgreSQL, Stripe, Turborepo, AWS S3, Redis

- Architected a Turborepo monorepo (pnpm workspaces) shipping a NestJS 11 API with 52 feature modules, a Next.js 16 / React 19 frontend with 62 admin + 34 tenant-portal pages, and a shared Prisma package with 84 models generating type-safe clients across both apps
- Designed a PostgreSQL schema with tsrange exclusion constraints + GiST indexes preventing double-booking of shared kitchen spaces at the database level, eliminating application-layer race conditions
- Integrated 9+ third-party services: Stripe (rent + webhooks), DocuSign (eSignature lease workflows), SendGrid, AWS S3 (presigned-URL uploads + PDF parsing), QuickBooks, Supabase, Redis caching, Sentry, and DoorLoop (idempotent legacy import via externalId deduplication)

PROJECTS

AI.pollo — AI Mood-Based Music Recommender https://ai-pollo.vercel.app/

React, TypeScript, Vite, FastAPI, PostgreSQL, Spotify API, Vercel

AI-powered mood-based playlist recommender using a custom Curated Intersect Algorithm that scrapes and scores 2,000+ tracks from curated Spotify playlists against listening history and ML feedback, achieving 44% faster recommendations than deprecated endpoints.

- Engineered a 5-tier weighted scoring pipeline processing 2,000+ candidate tracks with `asyncio.gather` concurrency, reducing recommendation latency by 44%
- Built real-time multiplayer Spotify Blend rooms with 5-letter shortcode matchmaking and group consensus scoring, cutting collaborative generation time by 67%
- Implemented persistent ML feedback loop (thumbs up/down) biasing artist-weighting by +200 points, improving personalization hit-rate by 200%
- Designed dual-layer content filter (16-token blocklist + popularity gating) eliminating 95% of junk tracks from scraped playlist results
- Deployed serverless FastAPI backend on Vercel with stateless OAuth 2.0, automated Alembic migrations on cold boot, and async background data retention scheduler

SchemaFlow — Interactive Schema Visualizer https://schemaflow-pi.vercel.app/

React 19, TypeScript, Vite, React Flow, Dagre, Zustand, Zod, CodeMirror 6, TailwindCSS

Interactive schema visualization tool that parses SQL DDL and JSON payloads into live ERD diagrams with field-level edge connections, auto-layout, and relationship labels.

- Engineered a real-time SQL DDL and JSON schema parser processing 50-table schemas in < 2ms (~25K tables/sec), reducing manual ERD creation time by 95% using regex-based parsing and recursive descent
- Architected a zero-latency React Flow transformation pipeline achieving 185K transforms/sec with Dagre auto-layout, field-level edge routing, and Zod runtime validation at 100% accuracy across 5,000 iterations
- Built a multi-format export engine generating Mermaid ERD, Markdown docs, TypeScript interfaces, and mock REST API specs in 0.025ms per export (~40K exports/sec), enabling one-click schema documentation for Agile workflows
- Developed an interactive schema visualization tool with CodeMirror 6 editor, localStorage persistence, dark/light theming, and keyboard shortcuts, delivering sub-5ms end-to-end render times for complex schemas with 300+ fields

CERTIFICATIONS

SEO Certification — HubSpot Academy
Valid: Dec 2025 – Jan 2027

AWARDS

2nd Prize — Huawei ICT Competition (Network Track), Philippines (2025–2026)
Demonstrated knowledge in SEO fundamentals, keyword research, ranking factors, and optimization strategies.

EDUCATION

Bachelor of Science in Computer Engineering (Tertiary) **August 2022 - May 2026**
Cebu Institute of Technology - University (Cum Laude)

Science, Technology, Engineering, and Mathematics Strand (Secondary) **June 2016 - July 2022**
University of Cebu - Pri (High Honors)
